AEC HACKATHON 2026 / CHALLENGE

TwinCity Copenhagen

A game-inspired digital property twin powered by Open Source data.

Presented by Henrik Herland Boelsmand

ejendom.com

Every building created in the real world
should appear in a virtual world too.

This challenge is about building a web-based, game-inspired visualisation of Denmark's buildings using open registry data from Datafordeler and BBR.

> *Think SimCity / RollerCoaster Tycoon vibes* — but powered by real buildings, real categories, and real property data.

Why this is exciting

PropTech has a lot of data, but most of it is still experienced through dashboards, spreadsheets, and maps. This challenge flips that into something more engaging.

Visual and playful

Instantly understandable and memorable. No more rows in a table.

Real-world relevance

Based on actual building data from Denmark's national registry (BBR).

High demo impact

The kind of project that looks great in a weekend hackathon showcase.

Genuinely useful

Can evolve into a digital twin interface, portfolio explorer, or data storytelling layer.

The goal is not to gamify data for fun. The goal is to explore a better interface for understanding buildings, portfolios, and cities.

What gets built this weekend

A working prototype of a browser-based world where buildings are rendered from BBR data and can be explored interactively.

Core prototype goals (MVP)

- Load building data from a defined area (e.g. Copenhagen)
- Render buildings in a game-like visual style (top-down or isometric)
- Visually differentiate buildings based on type/category
- Enable pan, zoom, and click interactions
- Show an info panel with building metadata (type, size, year, usage)
- Demonstrate that new buildings appear in the virtual world

Room for every skill

- Frontend / Game rendering
- Backend / Data ingestion
- GIS / Data modeling
- UX / Interaction design
- Product storytelling

Data and technical direction

Track 1

Nationwide digital twin

Use Datafordeler / BBR open building data to build a public-data digital twin concept. All of Denmark's building stock, visualized and explorable.

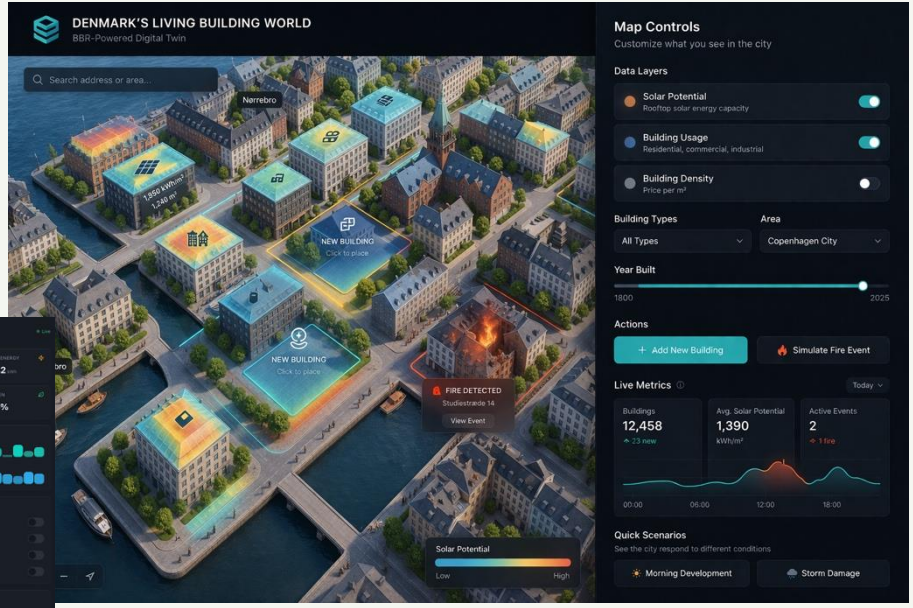
Track 2

PropTech product experience

Connect to a PropTech SaaS API (e.g. ejendom.com) to show how the same experience works as a product-facing interface for real customers and portfolios.

Both tracks are equally valid. Teams choose their own direction.

Visualization inspiration



This is purely to spark curiosity and inspiration rather than a set direction.

Stretch ideas (if teams move fast)

- Denmark-wide map with chunk loading
- Time slider: "watch the city grow over decades"
- Portfolio vs. nationwide mode toggle
- Highlight newly registered buildings from recent changes
- Data overlays: building age, usage mix, density heatmaps
- Animated "living city" effects: lights, movement, day/night
- Search by address, municipality, or building type

These are just starting points. Bring your own twist and surprise us.

The bigger vision

A living digital layer for buildings in Denmark — one that makes property and building data easier to understand, easier to explore, and far more engaging than traditional interfaces.

This weekend is about building the first version of that world.
